

# Troubleshooting: Cannot launch FakeProduct because of invalid hostname character

---

The FakeProduct application fails to launch. To resolve this issue, change the hostname to use a hyphen instead of an underscore.

## Issue

The FakeProduct application fails to launch, and the error message `Unable to launch application` is displayed.

## Details

If the hostname of the FakeProduct server contains an underscore, the FakeProduct application fails to launch successfully.

---

### **Note:**

Internet standards specify that an underscore is an invalid character for a hostname.

---

## Solution

Rename the hostname of the server using a hyphen (-) instead of an underscore (\_). For example, change the hostname from *fakeserver\_01* to *fakeserver-01*.
